microbe

noun | mi·crobe | \mī-krōb\

Simple Definition of MICROBE

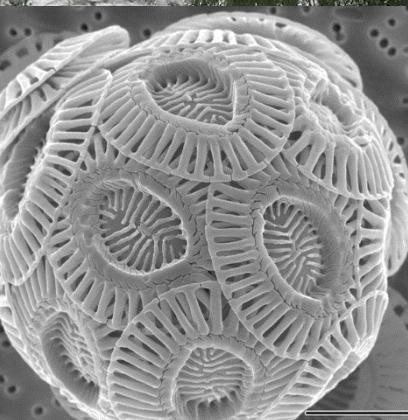

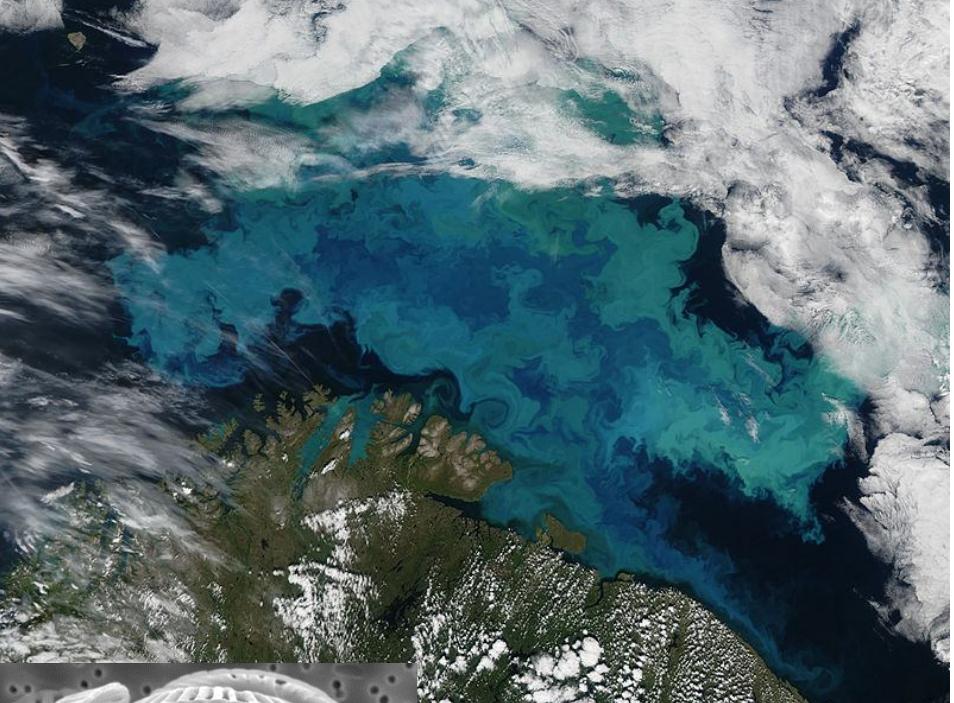

Popular

: an extremely small living thing that can only be seen with a microscope

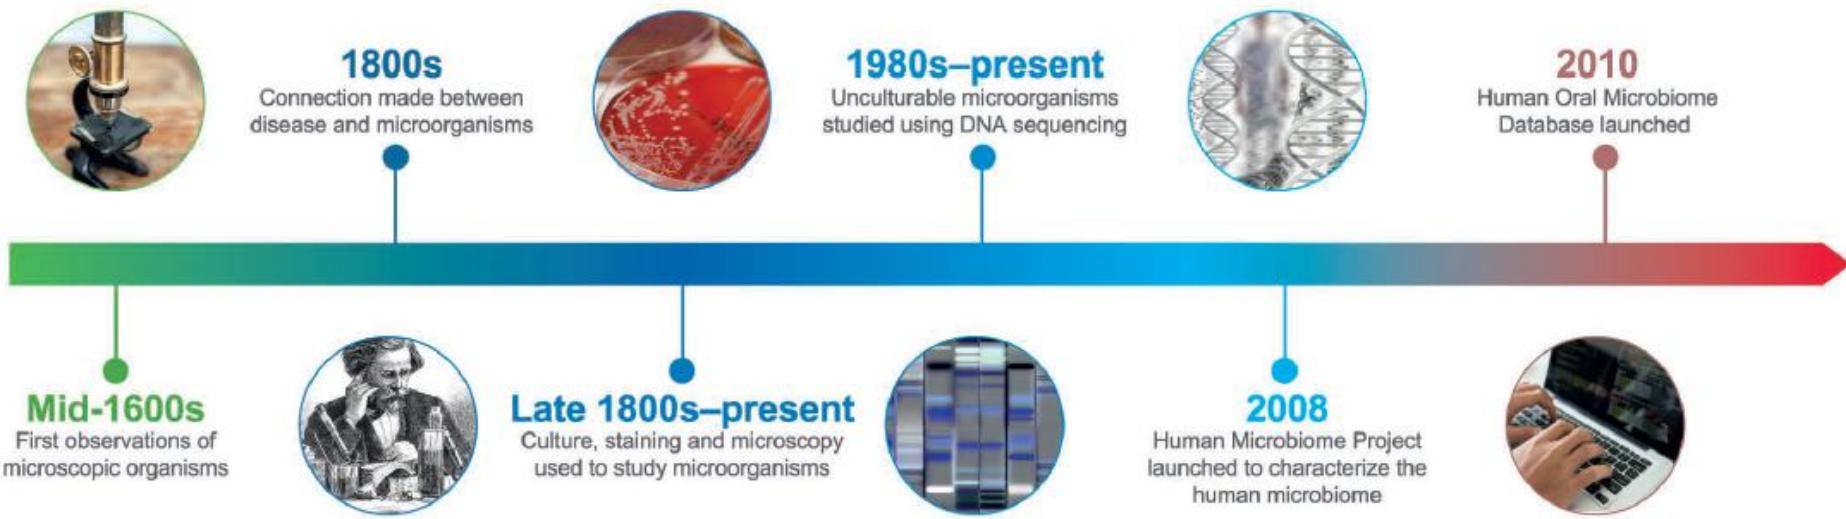

Emiliania huxleyi & satellites

LANDSAT Satellite image of *Emiliania huxleyi* bloom in the English Channel (Latitude 50°11'1""N and longitude 0°31'52""W) off the coast of Plymouth (Cornwall) 24, July 1999

Oral Microbiology: Past, Present and Future

First observations

- van Leeuwenhoek (1632 – 1723)
- In his notebook, he recorded "*I didn't clean my teeth for three days and then took the material that has lodged in small amounts on the gums above my front teeth..... I found a few living animalcules.*"

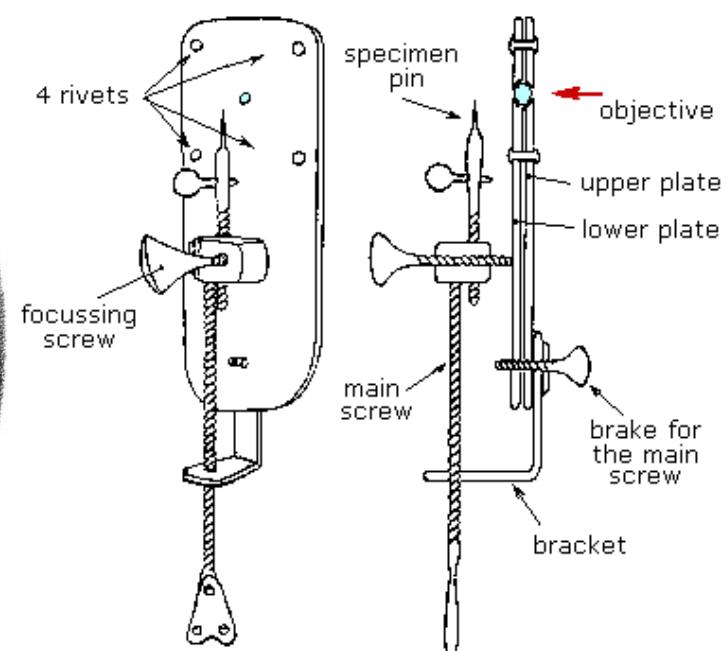

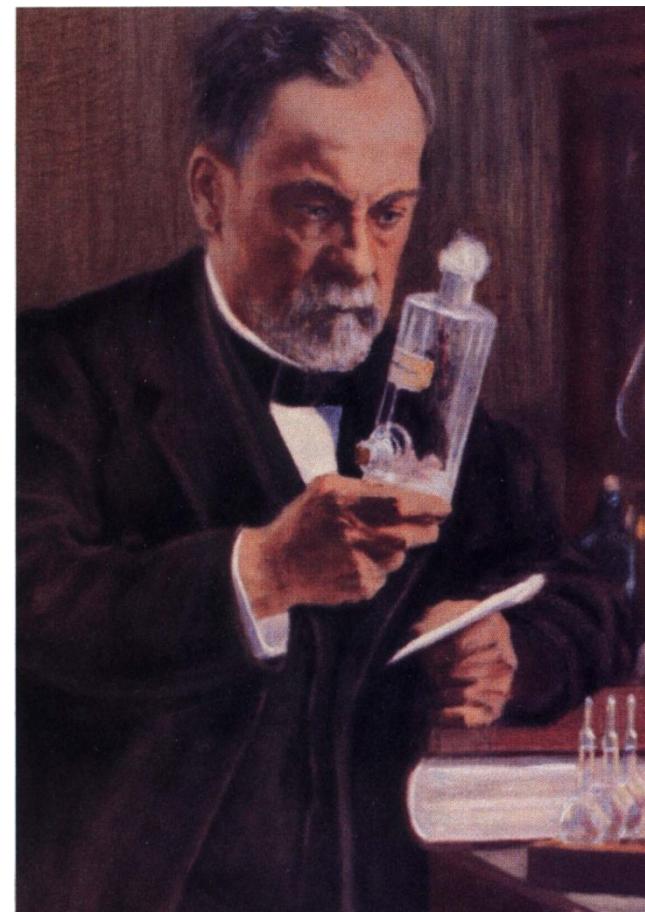

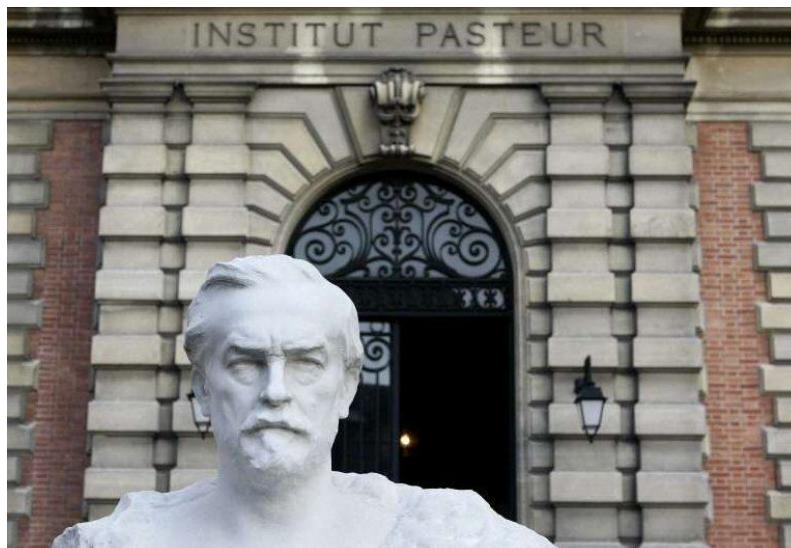

Figure 1 - Diagram of the microscope constructed by Antoni van Leeuwenhoek in the XVII century

Louis Pasteur (1822 – 1895)

- Pasteur (1857) demonstrated that lactic acid fermentation is due to the activity of microorganisms
- Pasteur (1861) conflict over spontaneous generation – birth of microbiology as a science
- Pasteur (1881) developed anthrax vaccine
- Pasteurization

Pasteur (1861)

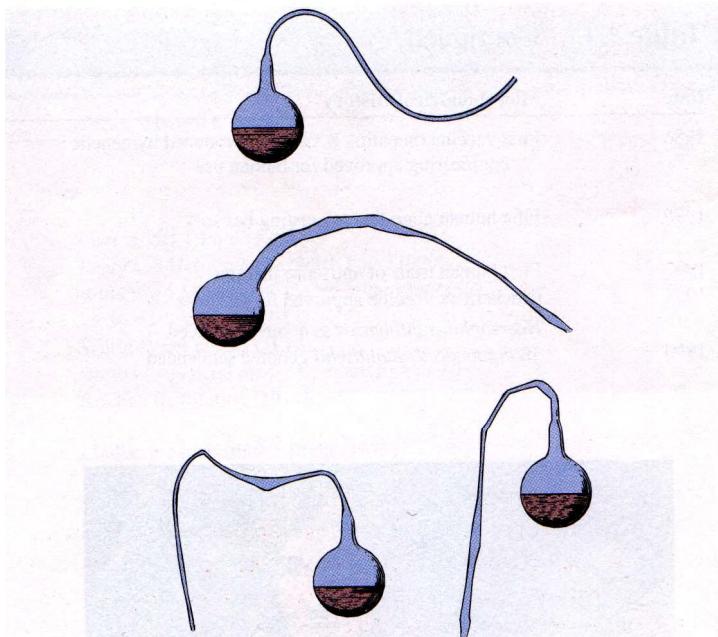

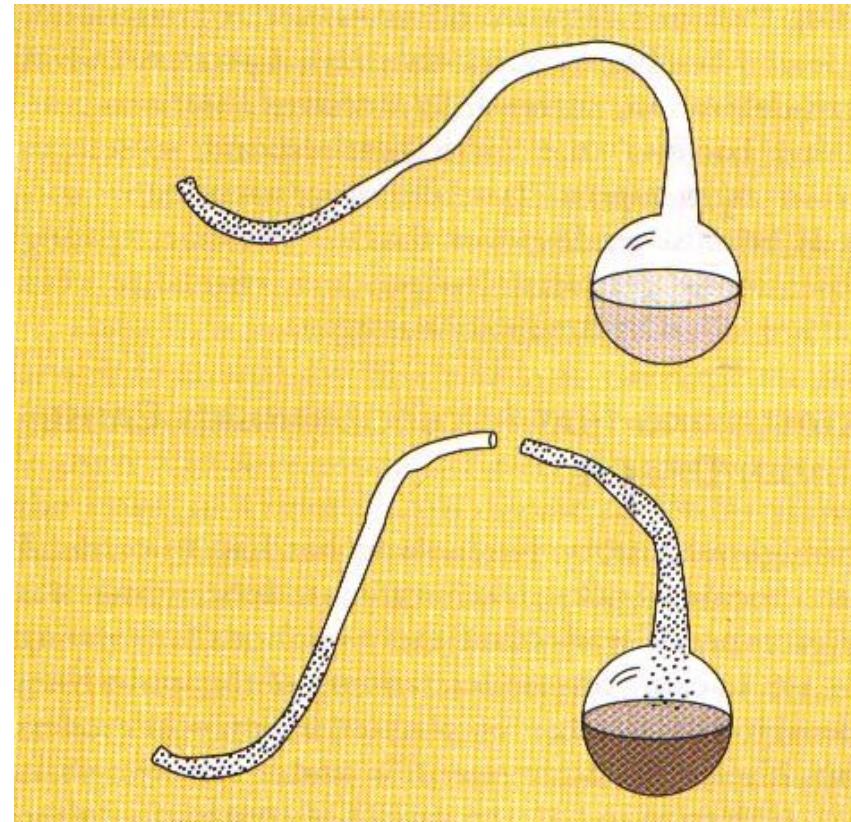

Figure 1.3 The Spontaneous Generation Experiment. Pasteur's swan neck flasks used in his experiments on the spontaneous generation of microorganisms. Source: Annales Sciences Naturelle, 4th Series, Vol. 16, pp. 1–98, Pasteur, L., 1861, "Mémoire sur les Corpuscules Organisés Qui Existent Dans L'Atmosphère: Examen de la Doctrine des Générations Spontanées."

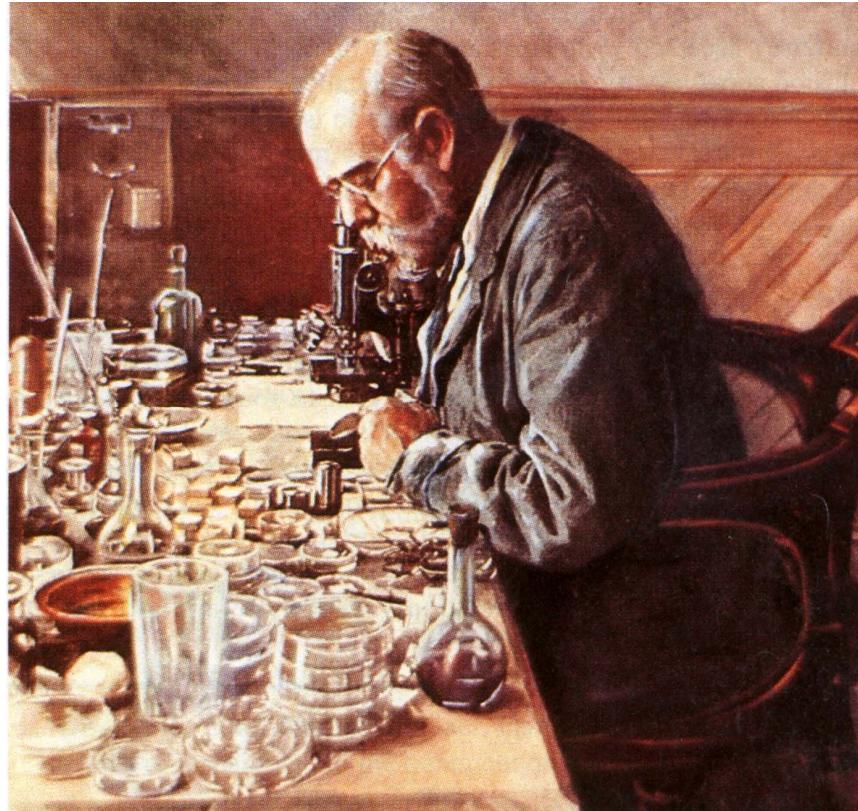

Pasteur's swan neck flasks used in his experiments on the spontaneous generation of microorganisms.

Microorganisms are not spontaneously generated from inanimate matter, but are produced by other microorganisms.

Robert Koch (1843 – 1910)

The recognition of microbial role in disease

(1884)

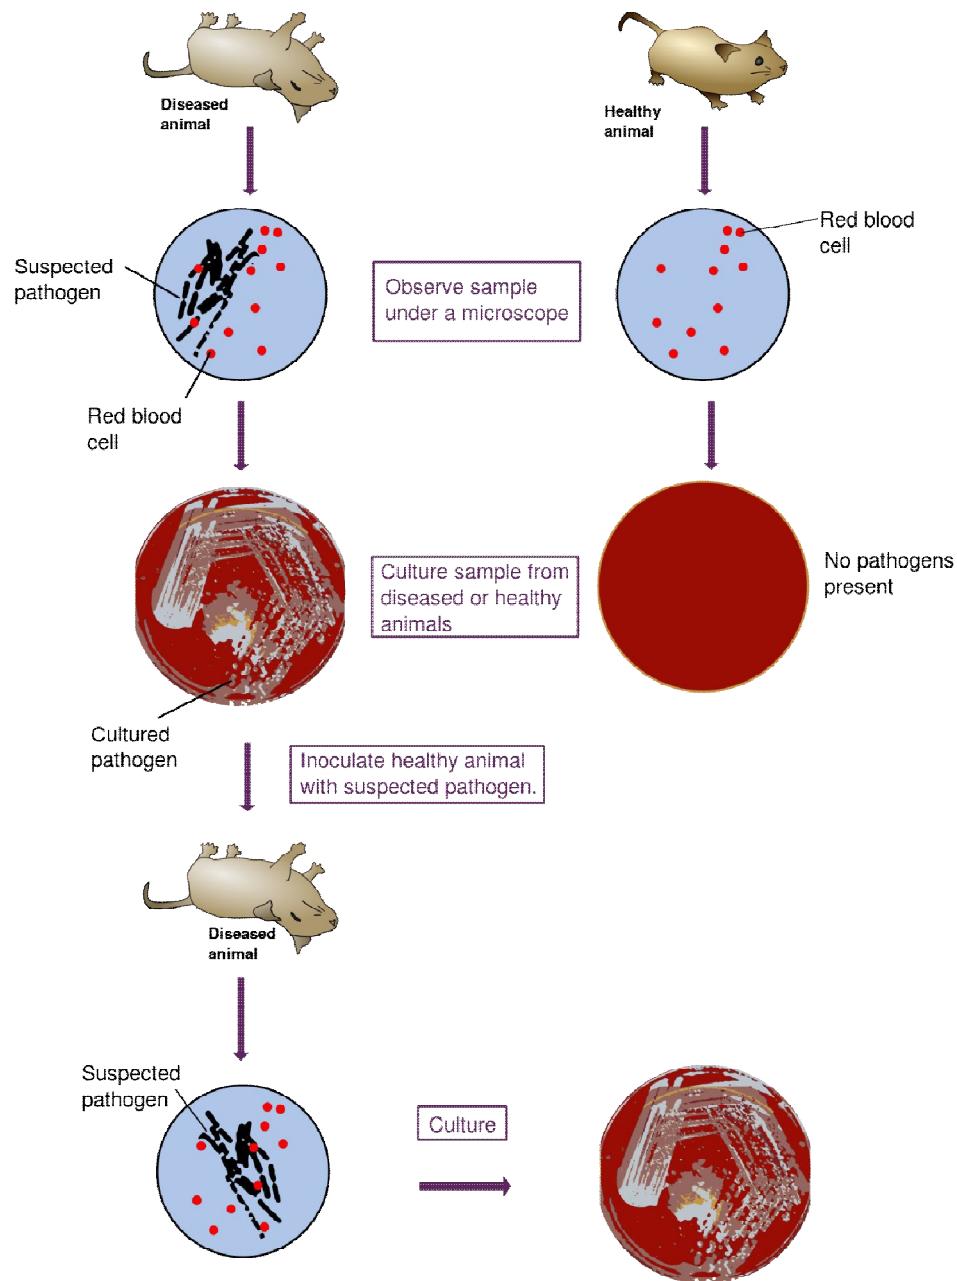

Koch's Postulates:

① The microorganism must be found in abundance in all organisms suffering from the disease, but should not be found in healthy organisms.

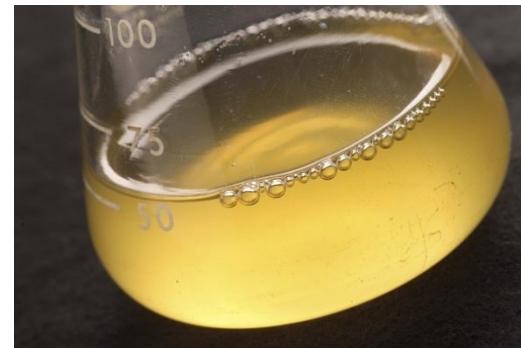

② The microorganism must be isolated from a diseased organism and grown in pure culture.

③ The cultured microorganism should cause disease when introduced into a healthy organism.

④ The microorganism must be reisolated from the inoculated, diseased experimental host and identified as being identical to the original specific causative agent.

SANIDAD

40 personas afectadas por un brote de listeriosis relacionado con una marca de carne mechada

Se trata de un producto comercializado con el nombre de 'La Mechá', fabricado por la firma Magrudis

Edificio del Hospital Virgen del Rocío de Sevilla.

- total de afectados: 210
- 3 personas muertas
- 5 abortos

La Consejería de Salud y Familias, a través de la Dirección General de Salud Pública y Ordenación Farmacéutica, ha decretado este jueves una **alerta sanitaria** sobre el producto de carne mechada con el nombre comercial '**La Mechá**', fabricado por la firma Magrudis, con domicilio en Sevilla capital, tras comprobar que este producto es el agente causante de los brotes de listeriosis registrados en Sevilla en las últimas semanas.

Según ha informado la Consejería en un comunicado, la alerta

Figure 2. VITEK 2 GN Colorimetric Identification Card.

There are currently four reagent cards available for the identification of different organism classes as follows:

1. GN - Gram-negative fermenting and non-fermenting bacilli
2. GP - Gram-positive cocci and non-spore-forming bacilli
3. YST - yeasts and yeast-like organisms
4. BCL - Gram-positive spore-forming bacilli

Figure 4. VITEK 2 Cassette Loaded with Cards and Suspension Tubes Being Loaded Into the Automatic Transport System.

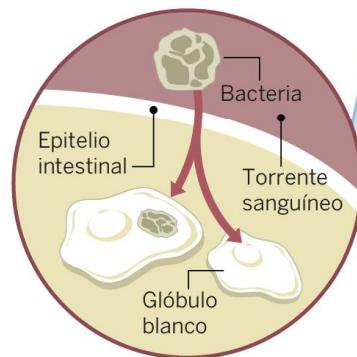

Listeria monocytogenes

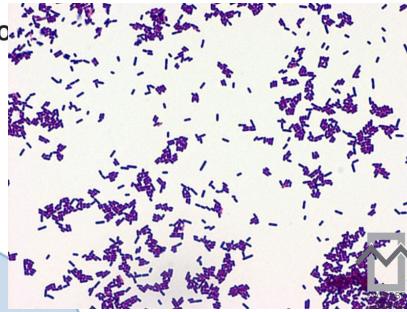

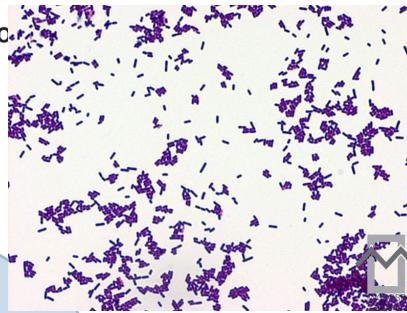

BROTE DE LISTERIOSIS

- 1 La listeriosis está causada por la bacteria *listeria monocytogenes*. La vía de contagio habitual es a través de alimentos infectados con la bacteria: carne poco hecha, leche no pasteurizada, etc.
- 2 La bacteria pasa al tracto intestinal y atraviesa el epitelio hasta llegar al torrente sanguíneo.

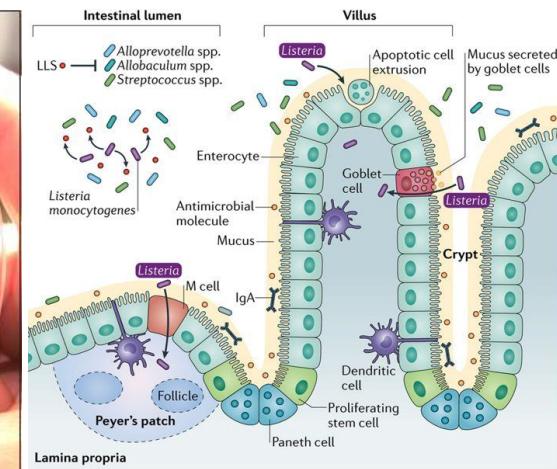

LA VÍA DE CONTAGIO

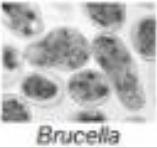

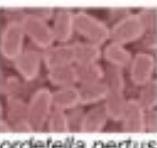

- 3 Una vez en la sangre, infecta a los glóbulos blancos y se multiplica. El patógeno resulta casi inocuo para la mayoría de las personas sanas, resultando más peligroso para ancianos, mujeres embarazadas o personas con el sistema inmune debilitado. En los casos más extremos los daños pueden afectar al cerebro, al corazón y a otros órganos.

Enfermedades infecciosas

ENFERMEDAD	BACTERIA	SINTOMAS	CONTAGIO
BOTULISMO	 <i>Clostridium botulinum</i>	Doble visión, visión borrosa, párpados caídos, dificultad para hablar, para tragar, sensación de sequedad en la boca, debilidad muscular que desciende a través del cuerpo: primero los hombros, luego los brazos, los muslos, las pantorrillas, etc. La parálisis de los músculos respiratorios puede causar la muerte. No se transmite de una persona a otra.	Ingestión de alimentos que posean la toxina producida por la bacteria.
BRUCELOSIS	 <i>Brucella</i>	Fiebre, escalofríos, dolores de cabeza, dolores corporales, y debilidad. La fiebre puede subir y bajar en un periodo de 24 horas ("fiebre ondulante").	Inoculación a través de heridas en los ganaderos, y veterinarios. Ingestión de leche o lácteos crudos
CÓLERA	 <i>Vibrio cholerae</i>	Afecta al tracto intestinal. Diarrea, vómitos y deshidratación leves o graves.	Por consumo de alimentos o agua contaminados por la materia fecal de una persona infectada. Se da con frecuencia en países subdesarrollados carentes de abastecimiento apropiado de agua y eliminación adecuada de aguas residuales.
TETANOS	 <i>Clostridium tetani</i>	Contracción muscular dolorosa. Parálisis muscular. Espasmos de laringe que pueden producir asfixia.	Heridas profundas en contacto con tierra infectada.
TOSFERINA	 <i>Bordetella pertussis</i>	Accesos de tos seca y con gran esfuerzo. Asfixia. Fatiga.	Directo por gotitas de tos.
TUBERCULOSIS	 <i>Mycobacterium tuberculosis</i>	Cavernas pulmonares. Espuñas sanguíneas. Fiebre. Fatiga. Pérdida de peso. Pueden invadir otros órganos como riñones, huesos o genitales.	Aire. Ropa. Utensilios de comida

Overview of Bacterial infections

Bacterial meningitis

- *Streptococcus pneumoniae*
- *Neisseria meningitidis*
- *Haemophilus influenzae*
- *Streptococcus agalactiae*
- *Listeria monocytogenes*

Otitis media

- *Streptococcus pneumoniae*

Pneumonia

Community-acquired:

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*
- *Staphylococcus aureus*

Atypical:

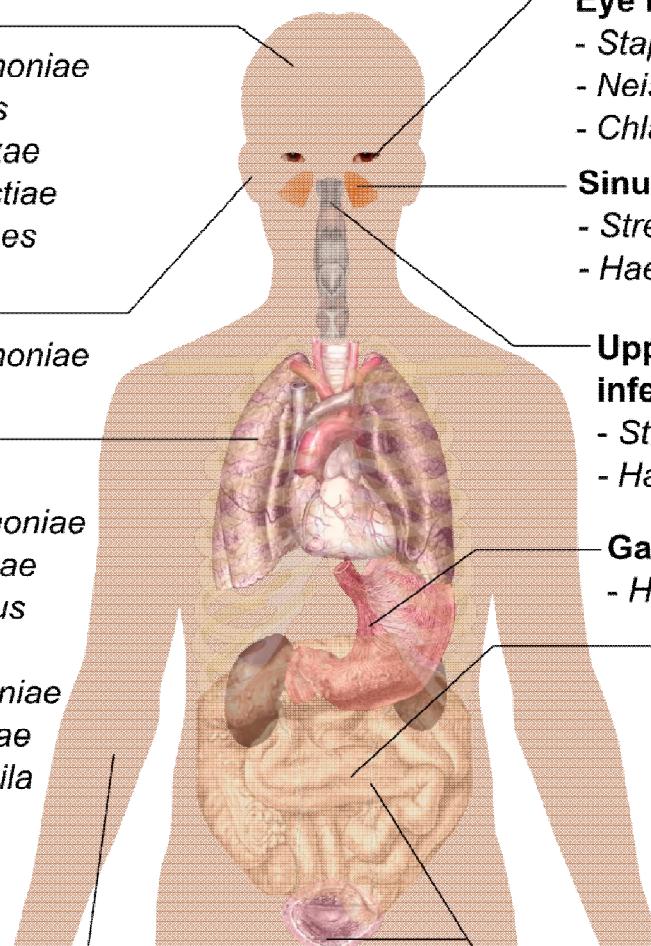

- *Mycoplasma pneumoniae*
- *Chlamydia pneumoniae*
- *Legionella pneumophila*

Tuberculosis

- *Mycobacterium tuberculosis*

Skin infections

- *Staphylococcus aureus*
- *Streptococcus pyogenes*
- *Pseudomonas aeruginosa*

Eye infections

- *Staphylococcus aureus*
- *Neisseria gonorrhoeae*
- *Chlamydia trachomatis*

Sinusitis

- *Streptococcus pneumoniae*
- *Haemophilus influenzae*

Upper respiratory tract infection

- *Streptococcus pyogenes*
- *Haemophilus influenzae*

Gastritis

- *Helicobacter pylori*

Food poisoning

- *Campylobacter jejuni*
- *Salmonella*
- *Shigella*
- *Clostridium*
- *Staphylococcus aureus*
- *Escherichia coli*

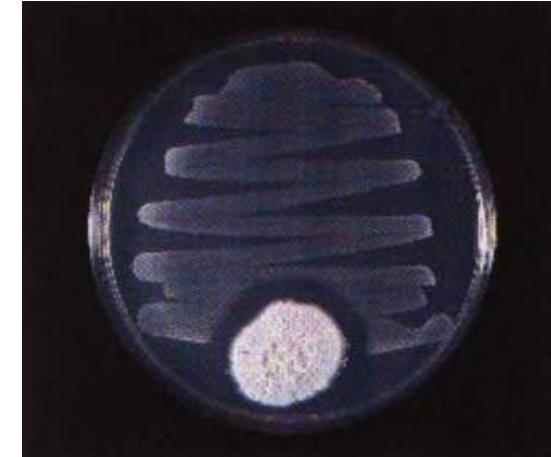

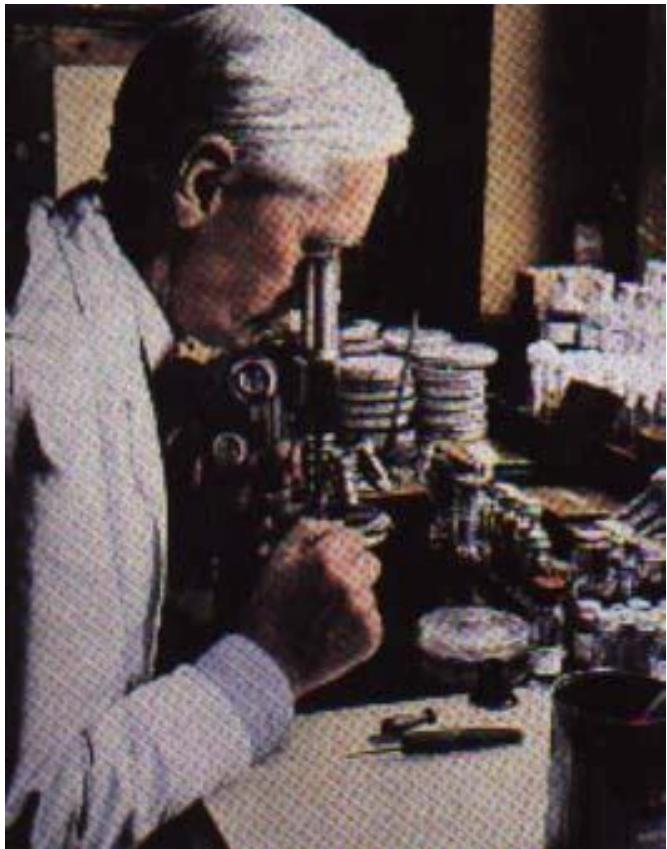

Sexually transmitted diseases

- *Chlamydia trachomatis*
- *Neisseria gonorrhoeae*
- *Treponema pallidum*
- *Ureaplasma urealyticum*
- *Haemophilus ducreyi*

Urinary tract infections

- *Escherichia coli*
- Other Enterobacteriaceae
- *Staphylococcus saprophyticus*
- *Pseudomonas aeruginosa*

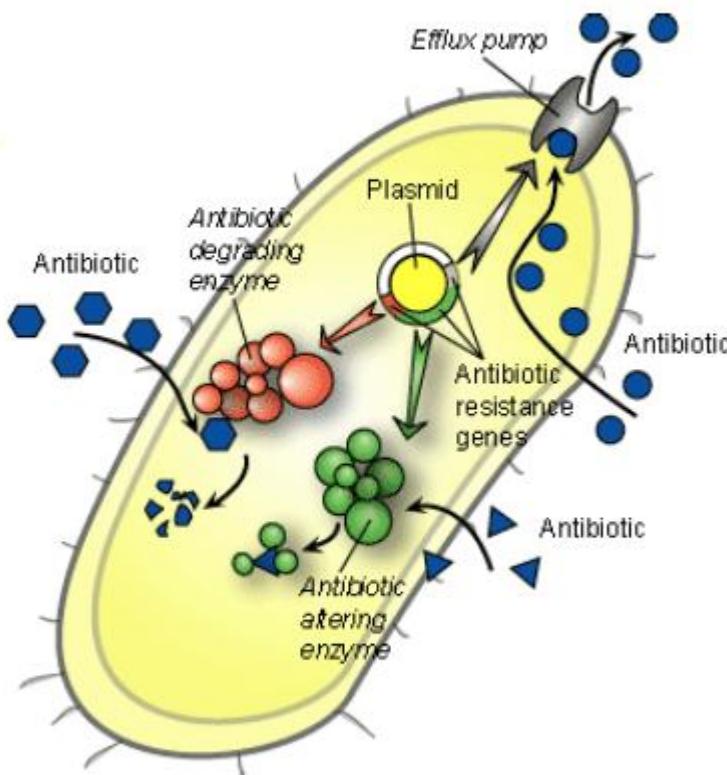

Alexander Fleming (1881-1955)

Sir Alexander Fleming (1929) discovered the antibiotic penicillin. He had the insight to recognize the significance of the inhibition of bacterial growth in the vicinity of a fungal contaminant.

As a result...resistance to antimicrobials

RECERCA

Al metro de Barcelona hi ha menys bacteris que als ambulatoris i als aeroports

Un estudi del CSIC ha constatat que la majoria de microorganismes que habiten al metro de Barcelona són innocus per a les personnes

EFE Barcelona 19/01/2017 13:20

TEMPS D'ESPERA DIFERENTS A Madrid (esquerra) el temps d'espera d'un tren a l'andana és molt més llarg que a Barcelona (dreta). / OLMO CALVO / FRANCESC MELCIÓN

Al metro de Barcelona hi viuen **10.000 bacteris** per metre cúbic d'aire, la majoria **innocus** per a les personnes i molts **menys que a qualsevol ambulatori o aeroport espanyol**, segons un estudi del **CSIC**.

El Centre d'Estudis Avançats de Blanes (CEAB-CSIC), a la Selva, i l'Institut de Diagnòstic Ambiental i Estudis de l'Aigua (IDAEA-CSIC), els dos del CSIC, han elaborat el **primer catàleg genètic de la comunitat microbiana del metro**, que serà útil per saber i controlar la **qualitat de l'aire** que respiren els usuaris del transport suburbà.

Human Microbiome

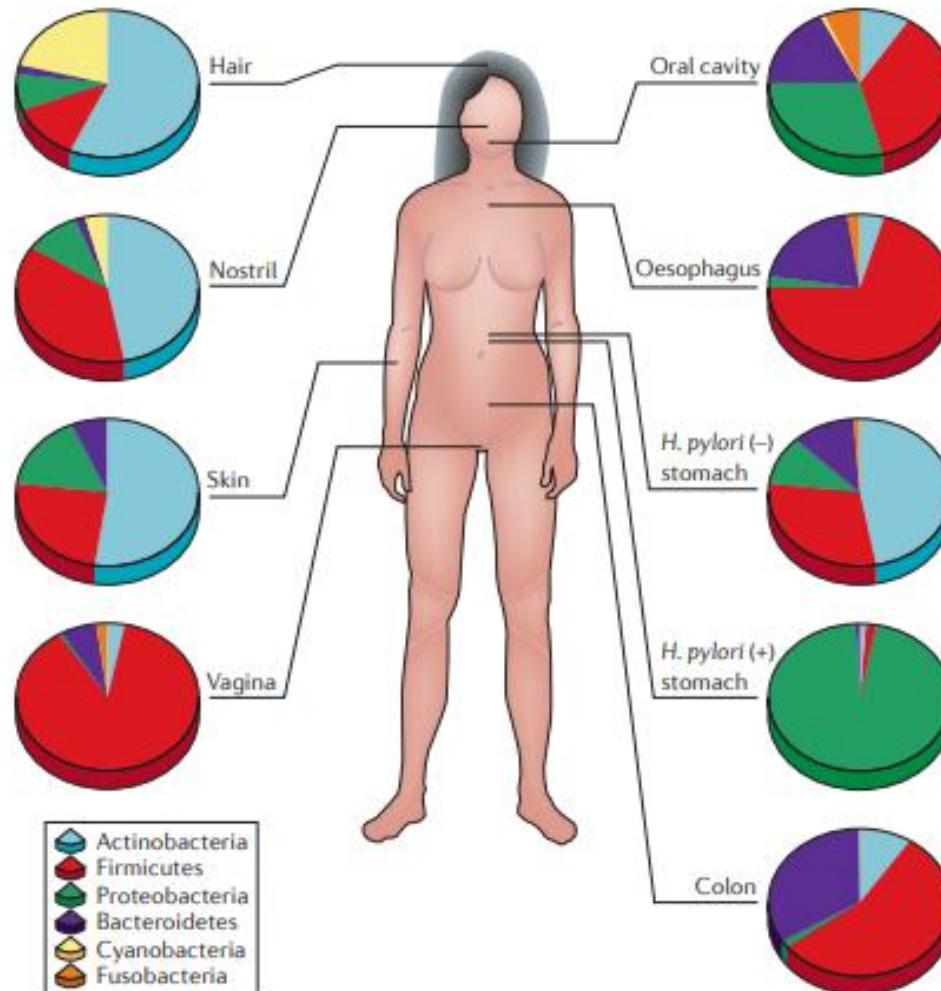

Table 1 | Examples of associations of human conditions with particular microbiota characteristics

Disease	Relevant finding	Refs
Psoriasis	Increased ratio of Firmicutes to Actinobacteria	88
Reflux oesophagitis	Oesophageal microbiota dominated by gram-negative anaerobes; gastric microbiota with low or absent <i>Helicobacter pylori</i>	75,133
Obesity	Reduced ratio of Bacteroidetes to Firmicutes	17,31
Childhood-onset asthma	Absent gastric <i>H. pylori</i> (especially the cytotoxin-associated gene A (<i>cagA</i>) genotype)	96,134
Inflammatory bowel disease (colitis)	Larger populations of Enterobacteriaceae	113
Functional bowel diseases	Larger populations of <i>Veillonella</i> and <i>Lactobacillus</i>	135
Colorectal carcinoma	Larger populations of <i>Fusobacterium</i> spp.	101,102
Cardiovascular disease	Gut-microbiota-dependent metabolism of phosphatidylcholine	136

Microbiome

IN NUMBERS

100 Trillion

symbiotic microbes live in and on every person and make up the human microbiota

The human body has more microbes than there are stars in the milky way

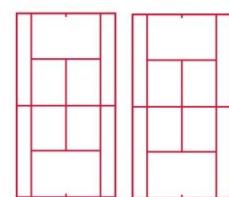

95%

of our microbiota is located in the GI tract

150:1

The genes in your microbiome outnumber the genes in our genome by about 150 to one

The surface area of the GI tract is the same size as 2 tennis courts

>10,000

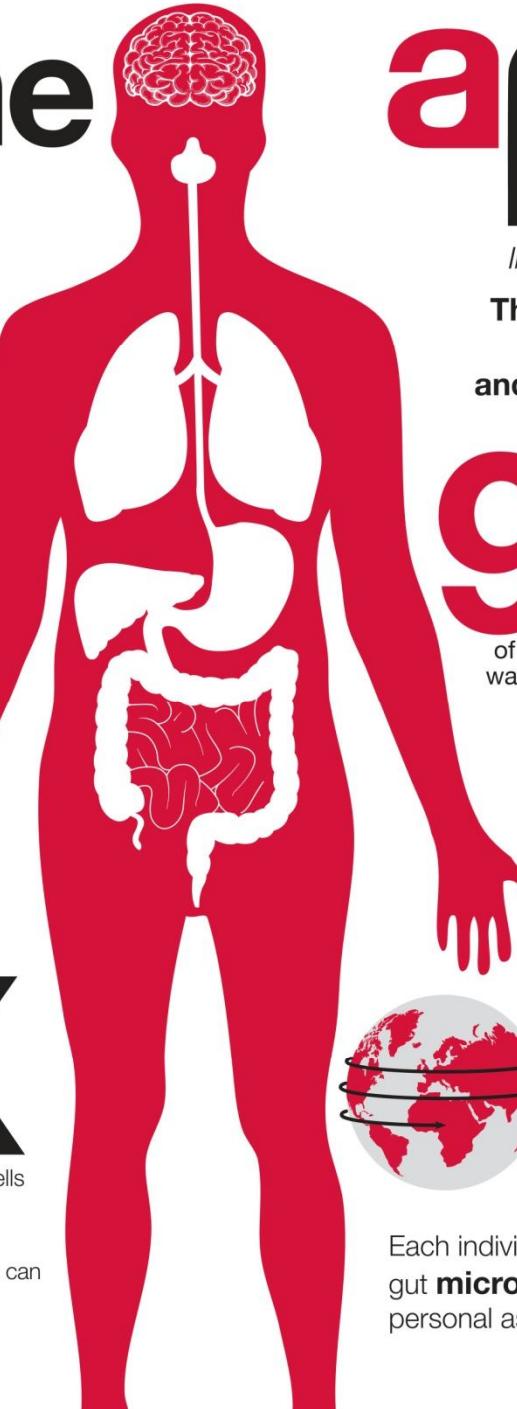

Number of different microbial species that researchers have identified living in and on the human body

1.3X

more microbes than human cells

The gut microbiota can weigh up to 2Kg

Interfacing Food & Medicine

The microbiome is more medically accessible and manipulable than the human genome

90%

It is thought that 90% of disease can be linked in some way back to the gut and health of the microbiome

5:1

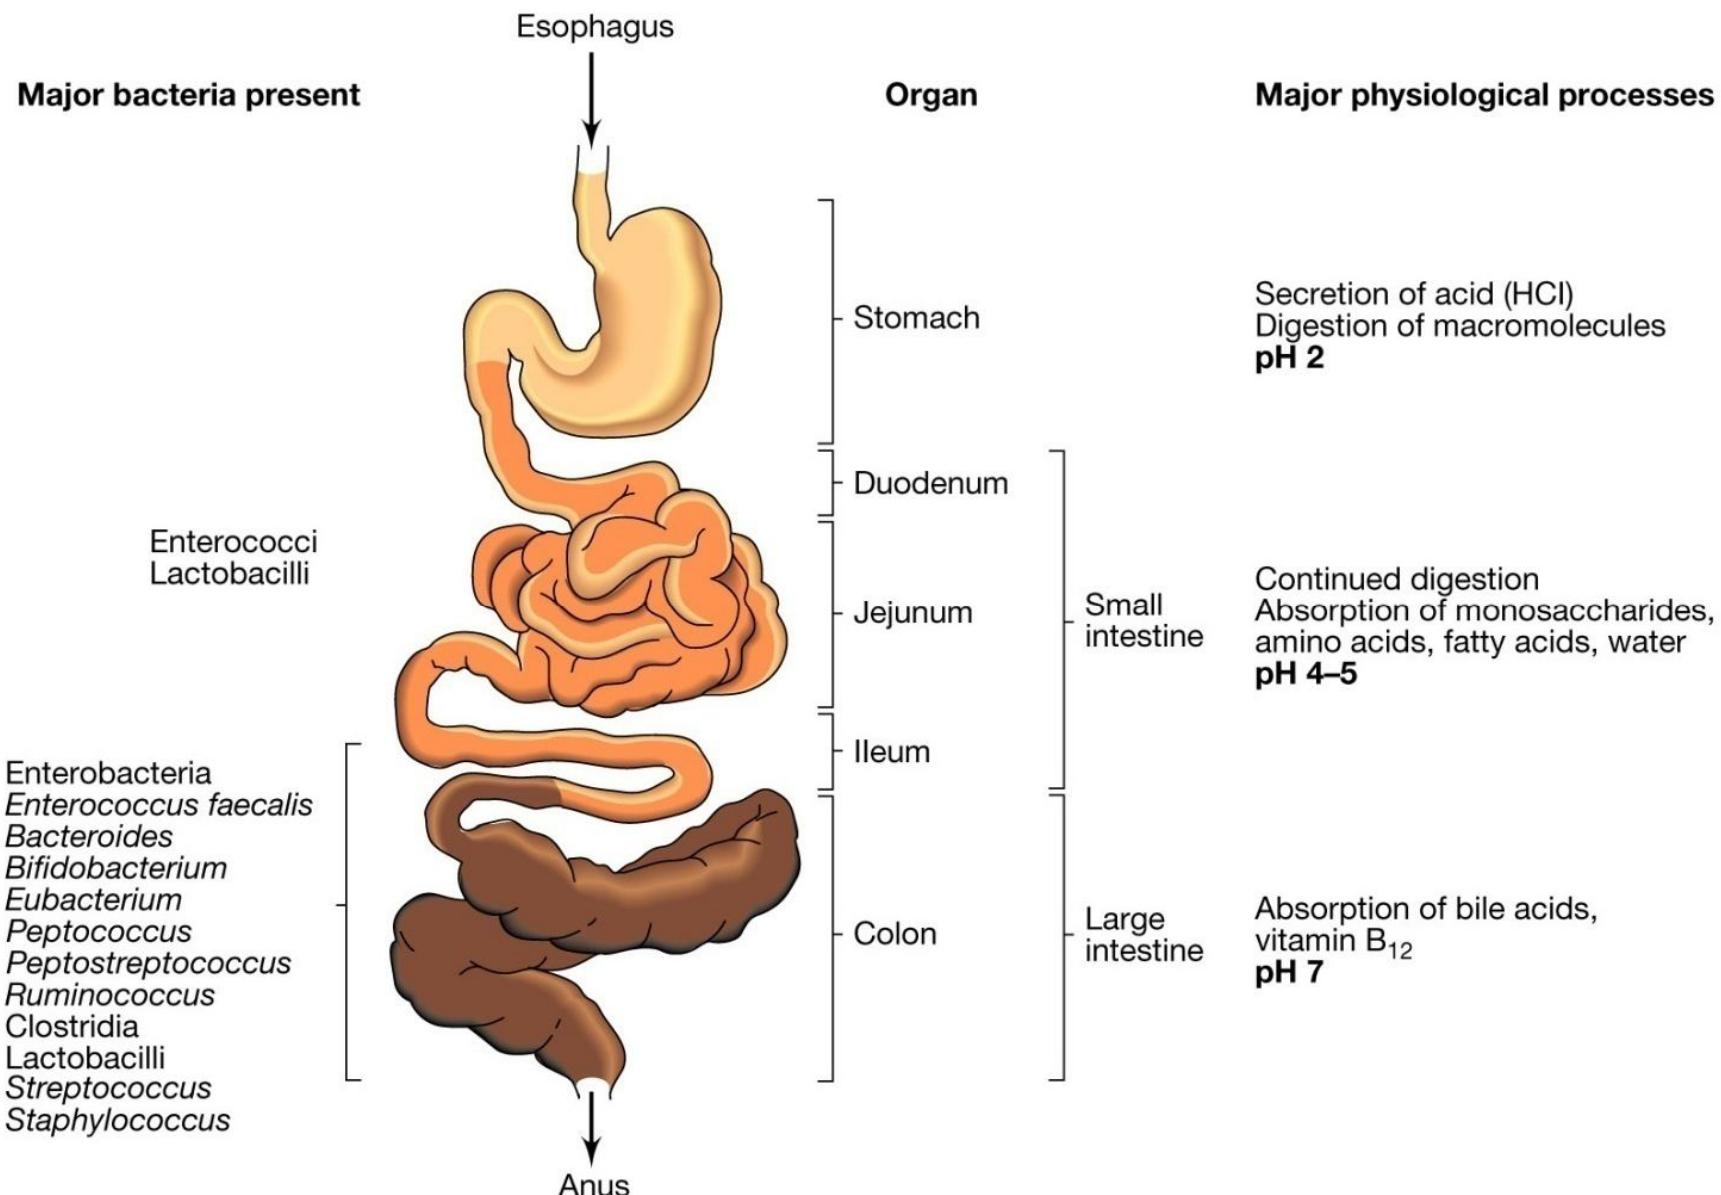

Viruses:Bacteria in the gut microbiota

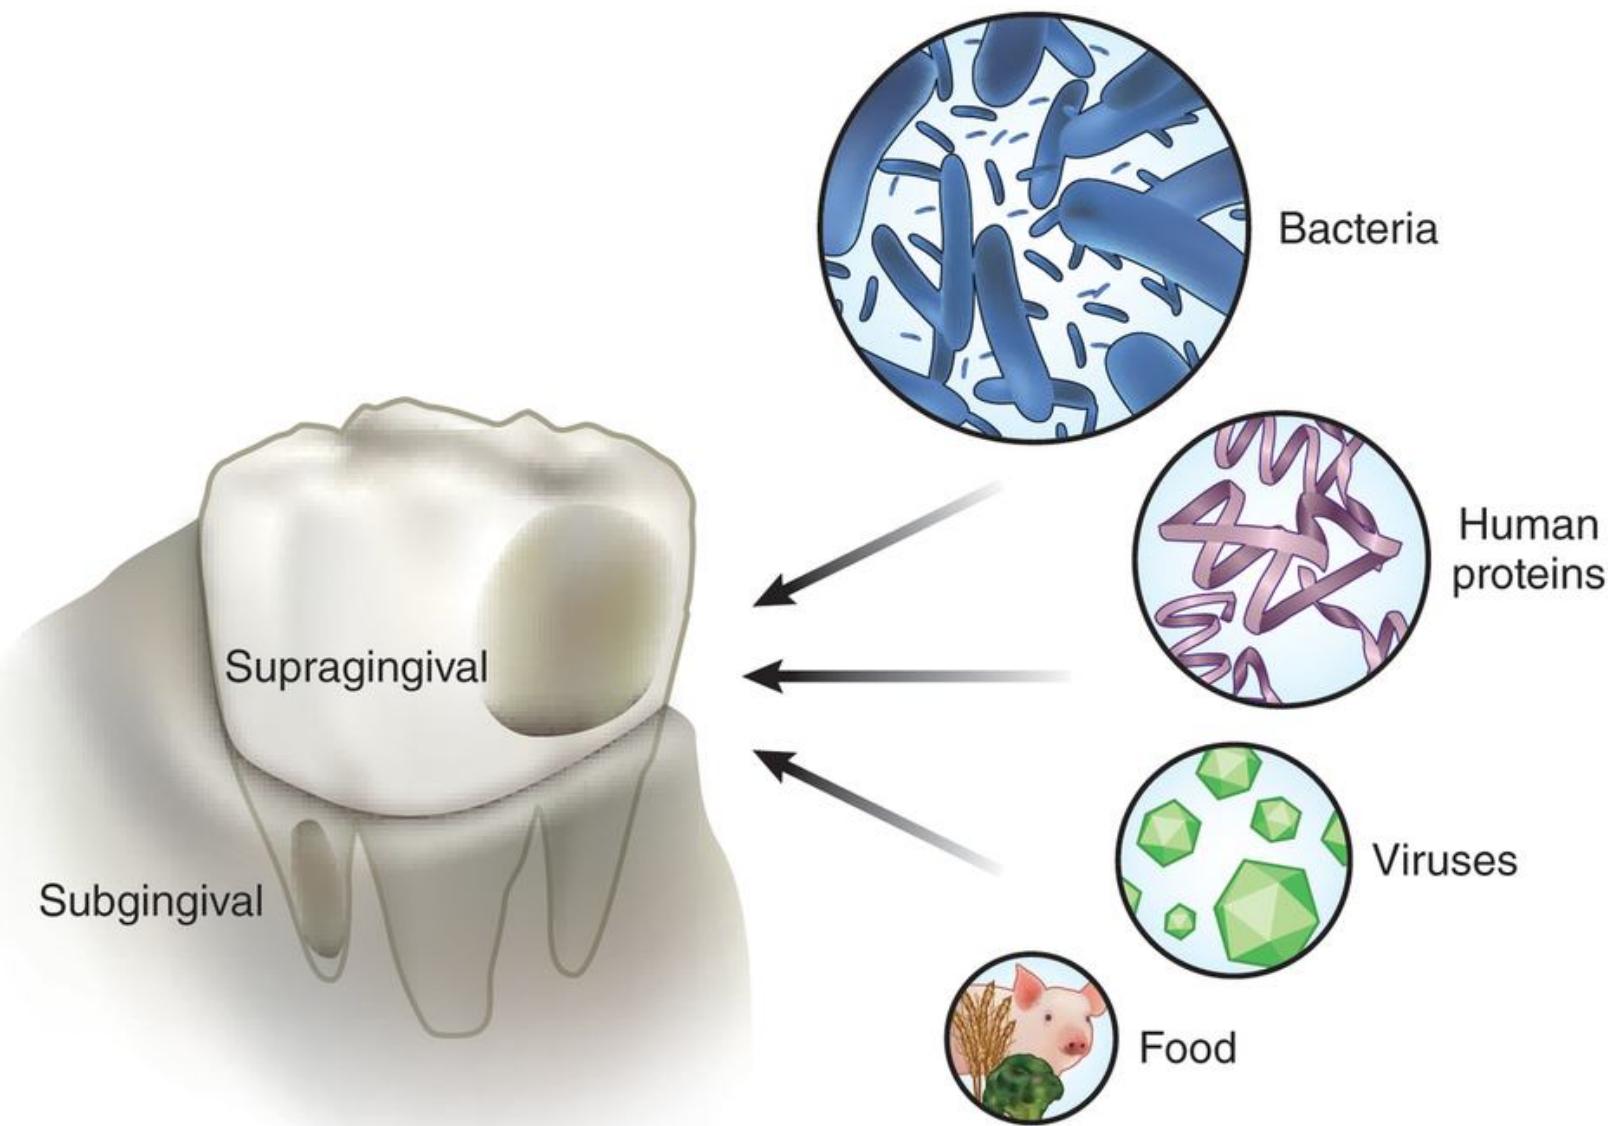

2.5 The number of times your body's microbes would circle the earth if positioned end to end

Each individual has a unique gut **microbiota**, as personal as a fingerprint

THE CHEMISTRY OF BODY ODOURS

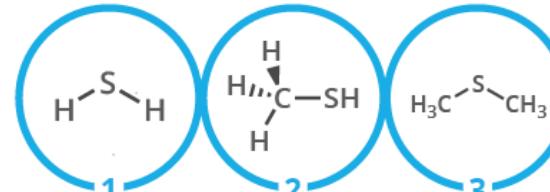

Body odour is the result of bacterial activity producing odorous compounds. Here, we look at some of the main compounds in particular odours.

HALITOSIS

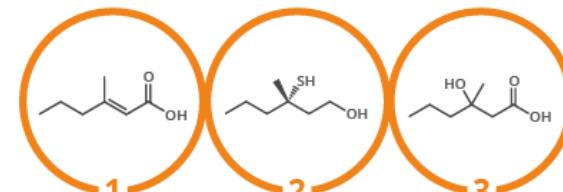

NAME	SMELLS LIKE
1. METHANETHIOL	sulfur, garlic
2. HYDROGEN SULFIDE	sulfur, rotting eggs
3. DIMETHYL SULFIDE	cabbage, sulfur, sweet

FLATULENCE

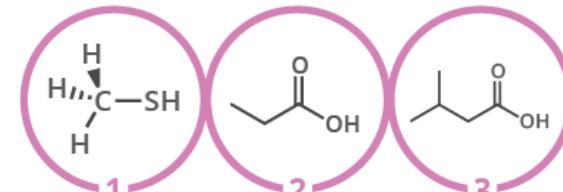

NAME	SMELLS LIKE
1. HYDROGEN SULFIDE	sulfur, rotting eggs
2. METHANETHIOL	sulfur, garlic
3. DIMETHYL SULFIDE	cabbage, sulfur, sweet

UNDERARM ODOUR

NAME	SMELLS LIKE
1. (E)-3-METHYL-2-HEXENOIC ACID	goat
2. (S)-3-METHYL-3-SULFANYLHEXAN-1-OL	onion
3. 3-HYDROXY-3-METHYLHEXANOIC ACID	cumin

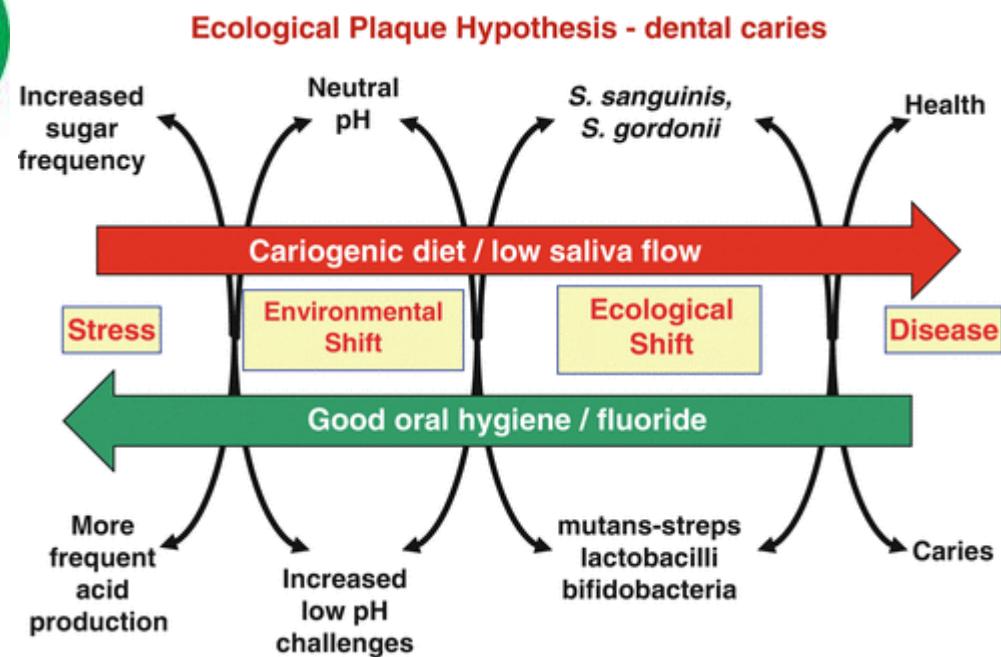

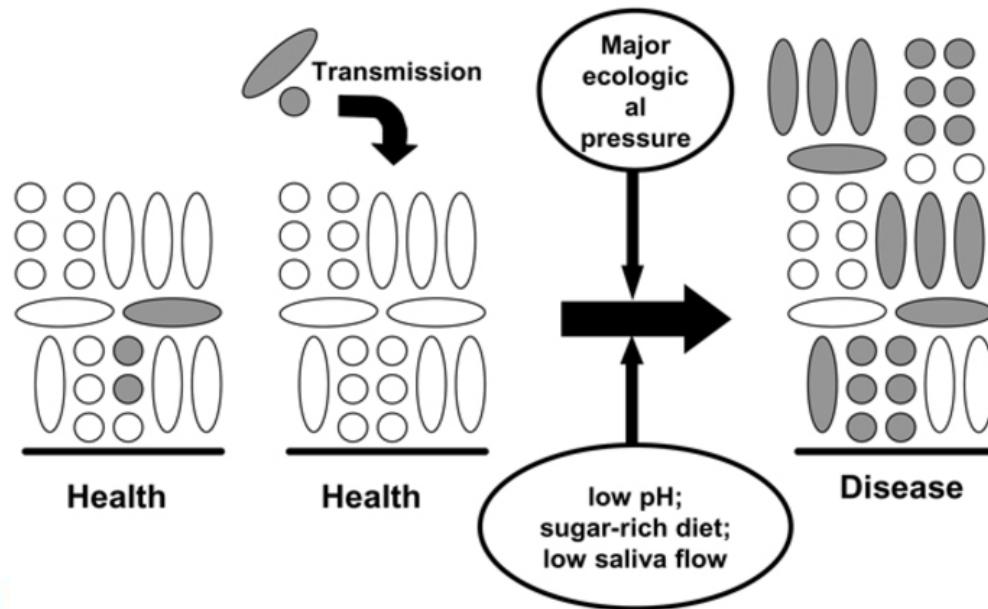

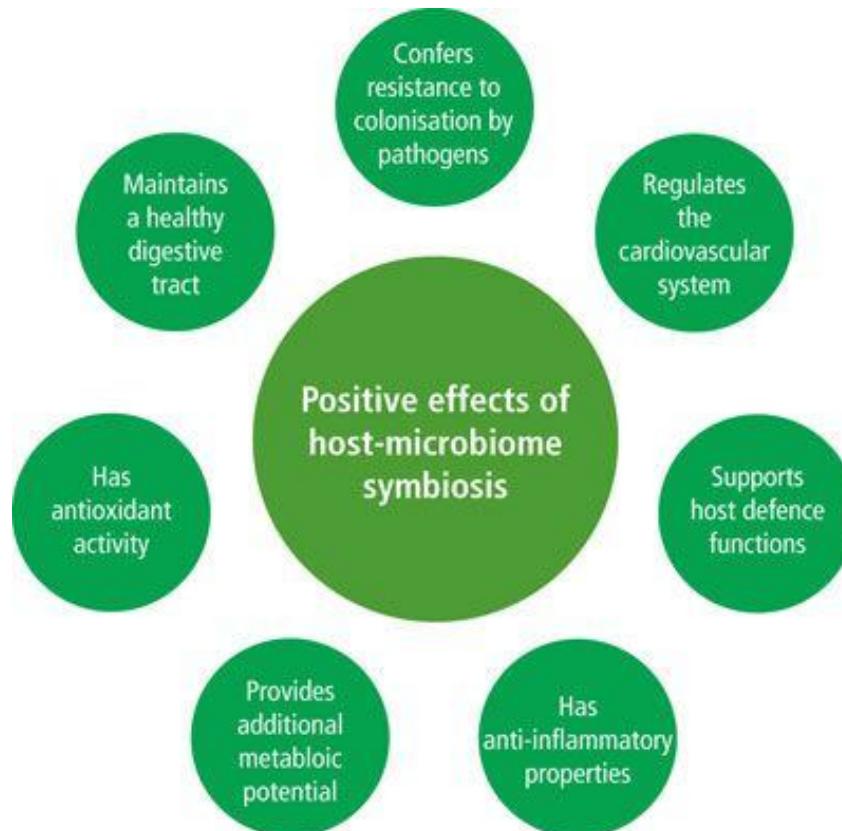

FOOT ODOUR

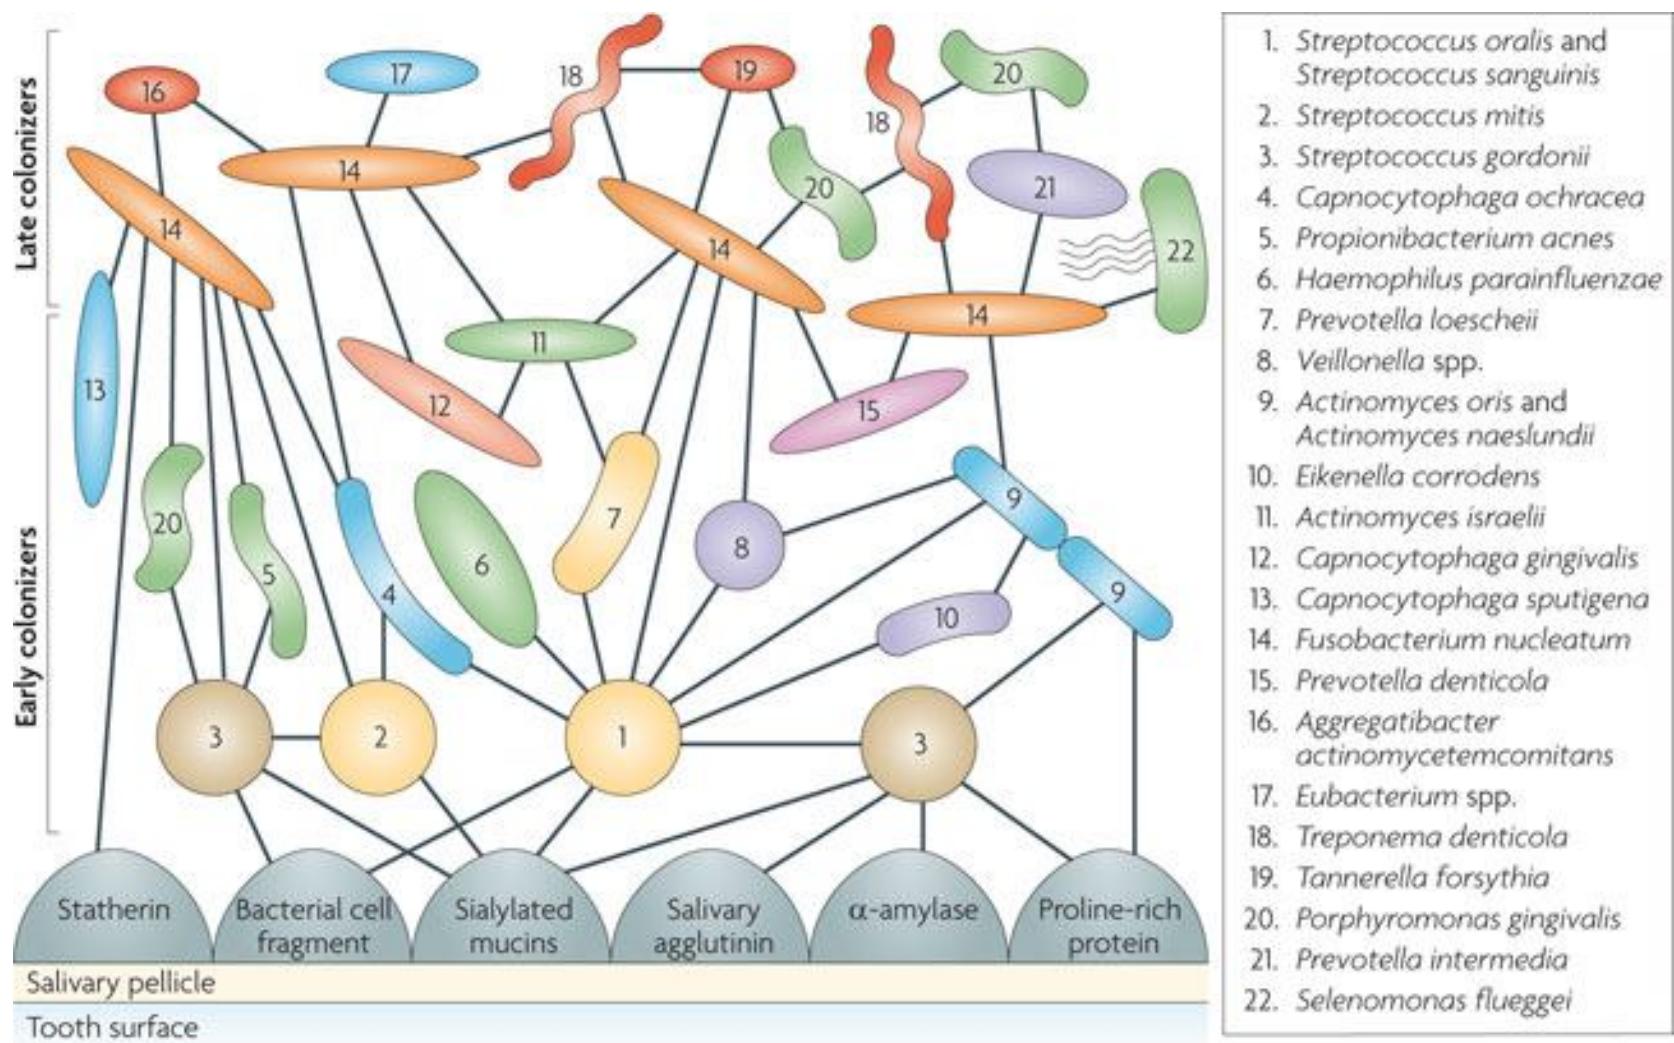

NAME	SMELLS LIKE
1. METHANETHIOL	sulfur, garlic
2. PROPANOIC ACID	pungent, rancid, sour
3. ISOVALERIC ACID	cheesy, fermented, rancid

Gene transfer in biofilms

Quant fa que tenim bacteris a la boca?

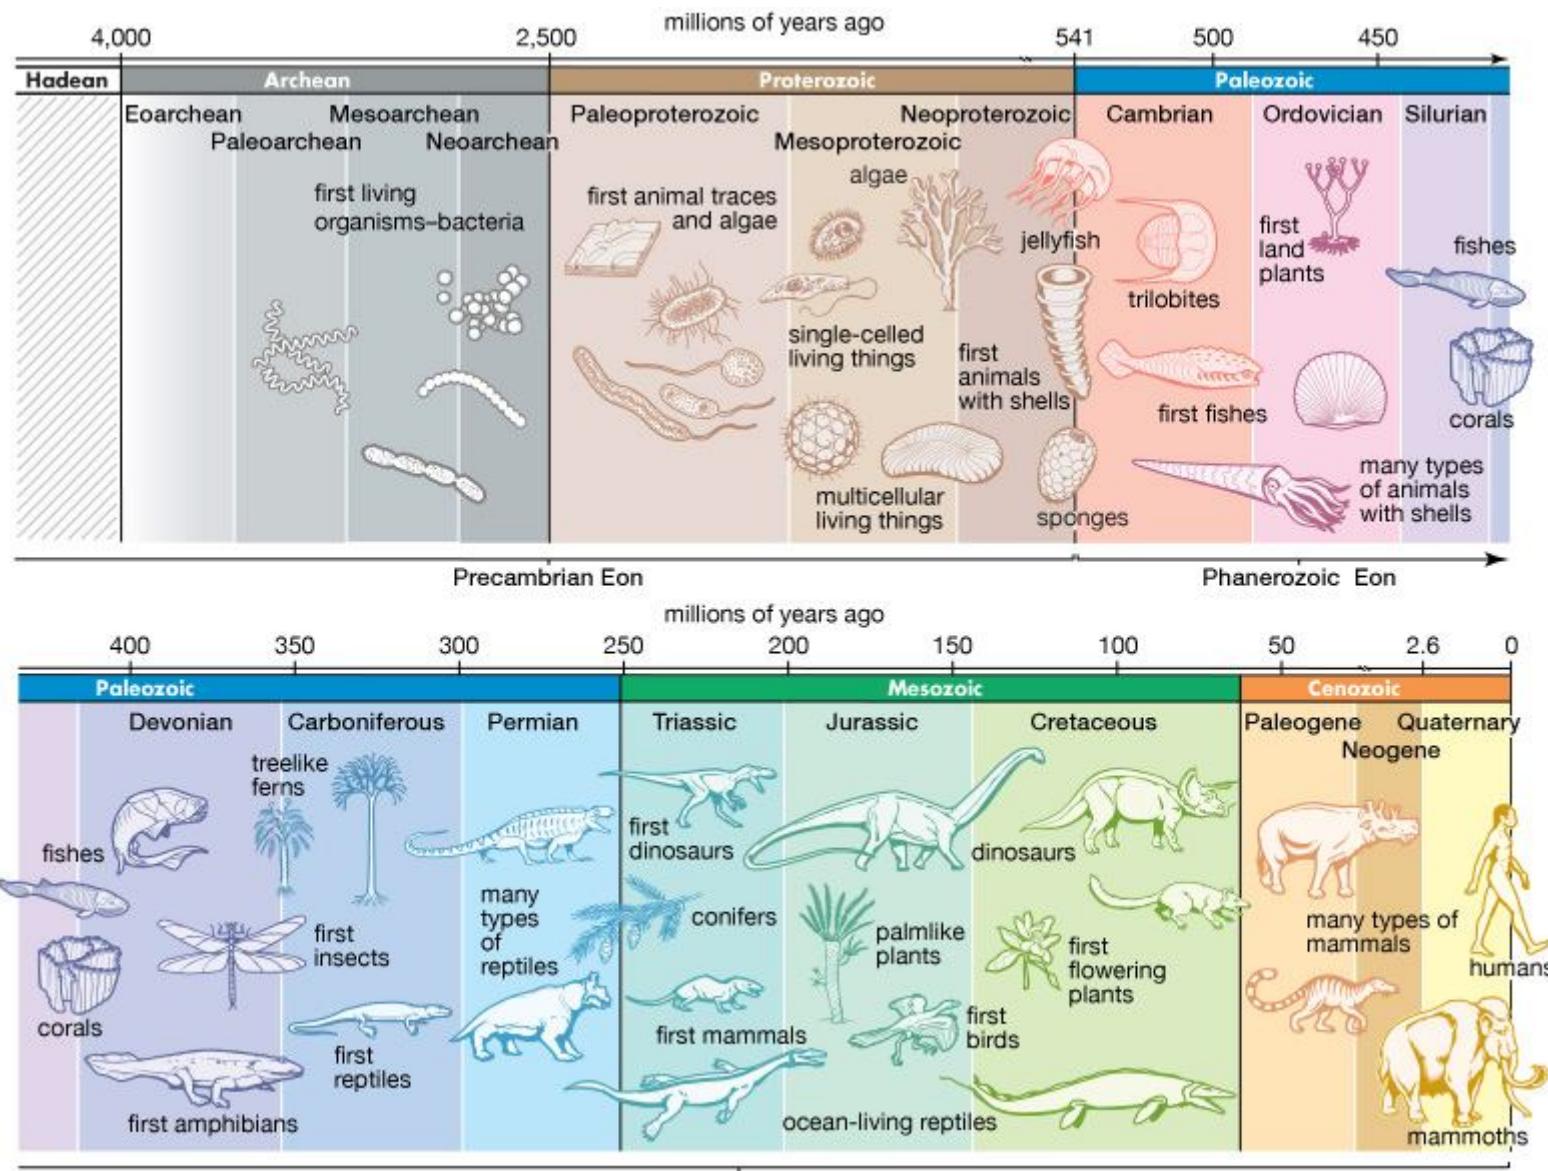

MARCH 9, 2017

Neanderthals were vegetarian—and probably kissed early humans

by Chuck Bednar

© 2013 Encyclopædia Britannica, Inc.

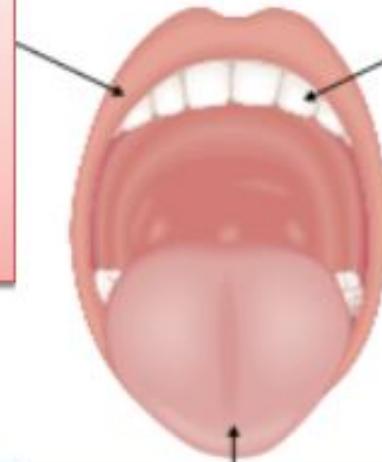

The mouth as microbial habitat

Cheeks, lips, palate

- Desquamation
- Saliva is major influence
- Microbiota has low diversity
- Facultative anaerobes
- *Streptococcus* spp. predominate

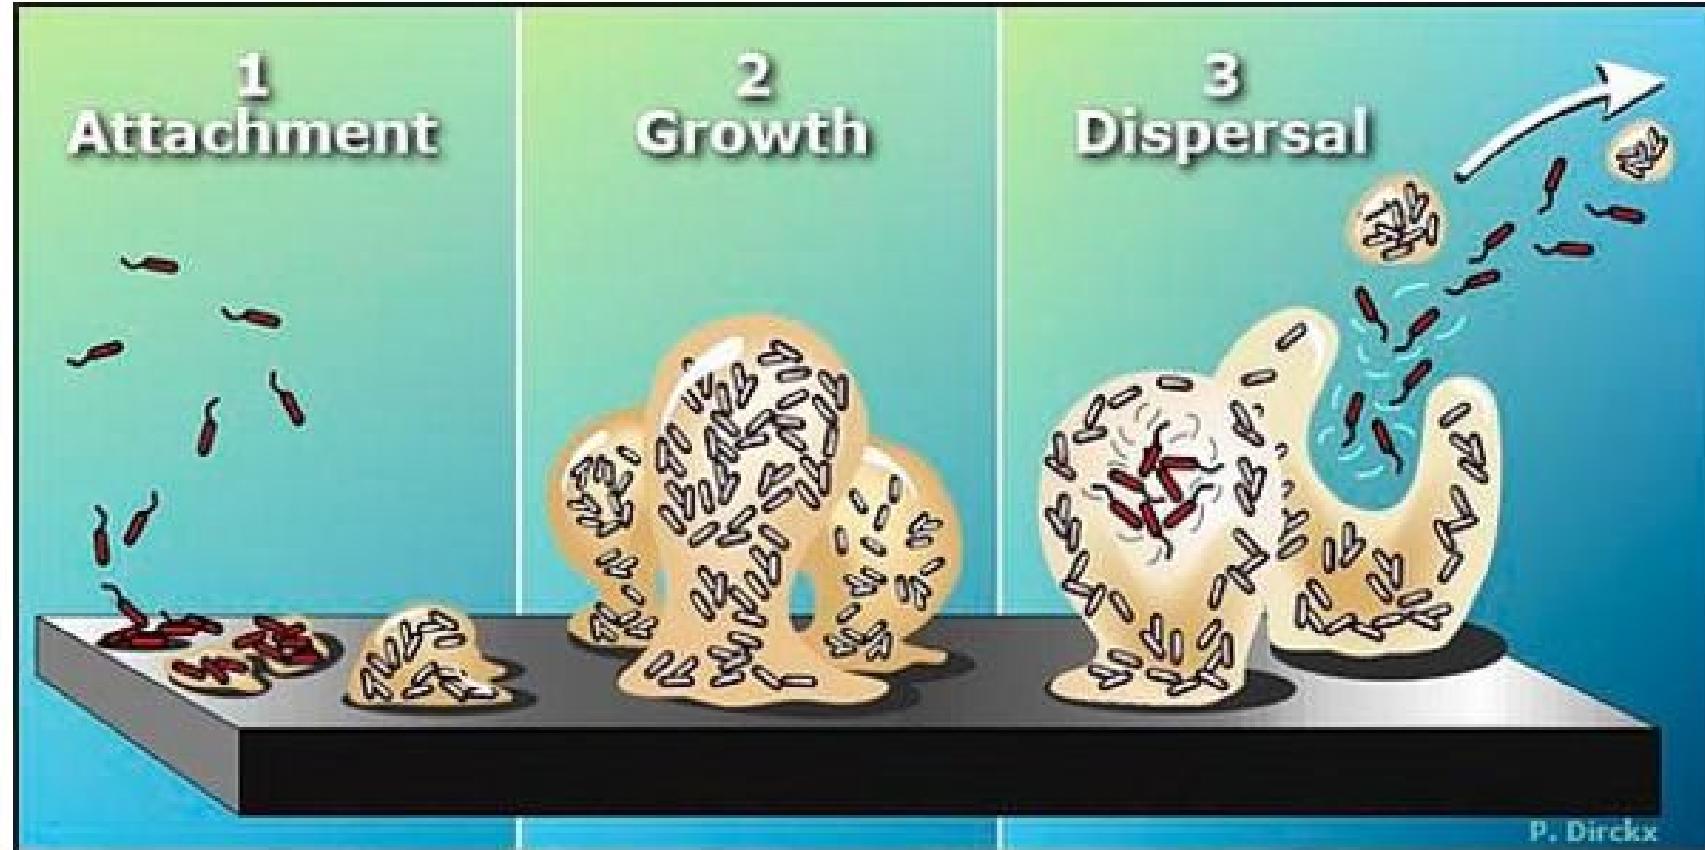

Teeth

- Non-shredding surface
- Stagnant sites: food impaction possible
- Diverse microbiota; site variation
- Many obligate anaerobes
- Influenced by saliva
- *Streptococcus, Actinomyces, Neisseria*, unculturable organisms

Tongue

- Highly papillated surface
- Some anaerobic sites
- Desquamation
- Diverse microbiota
- Facultative and obligate anaerobes
- *Streptococcus, Actinomyces*, some Gram negative anaerobes

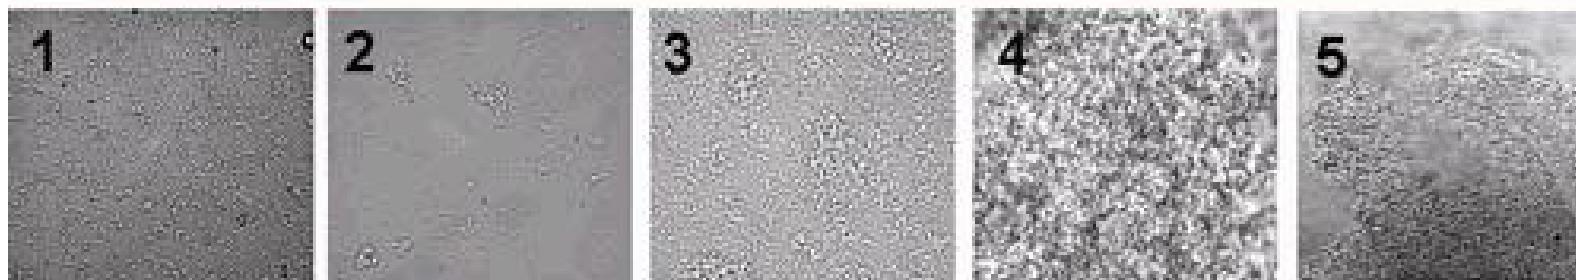

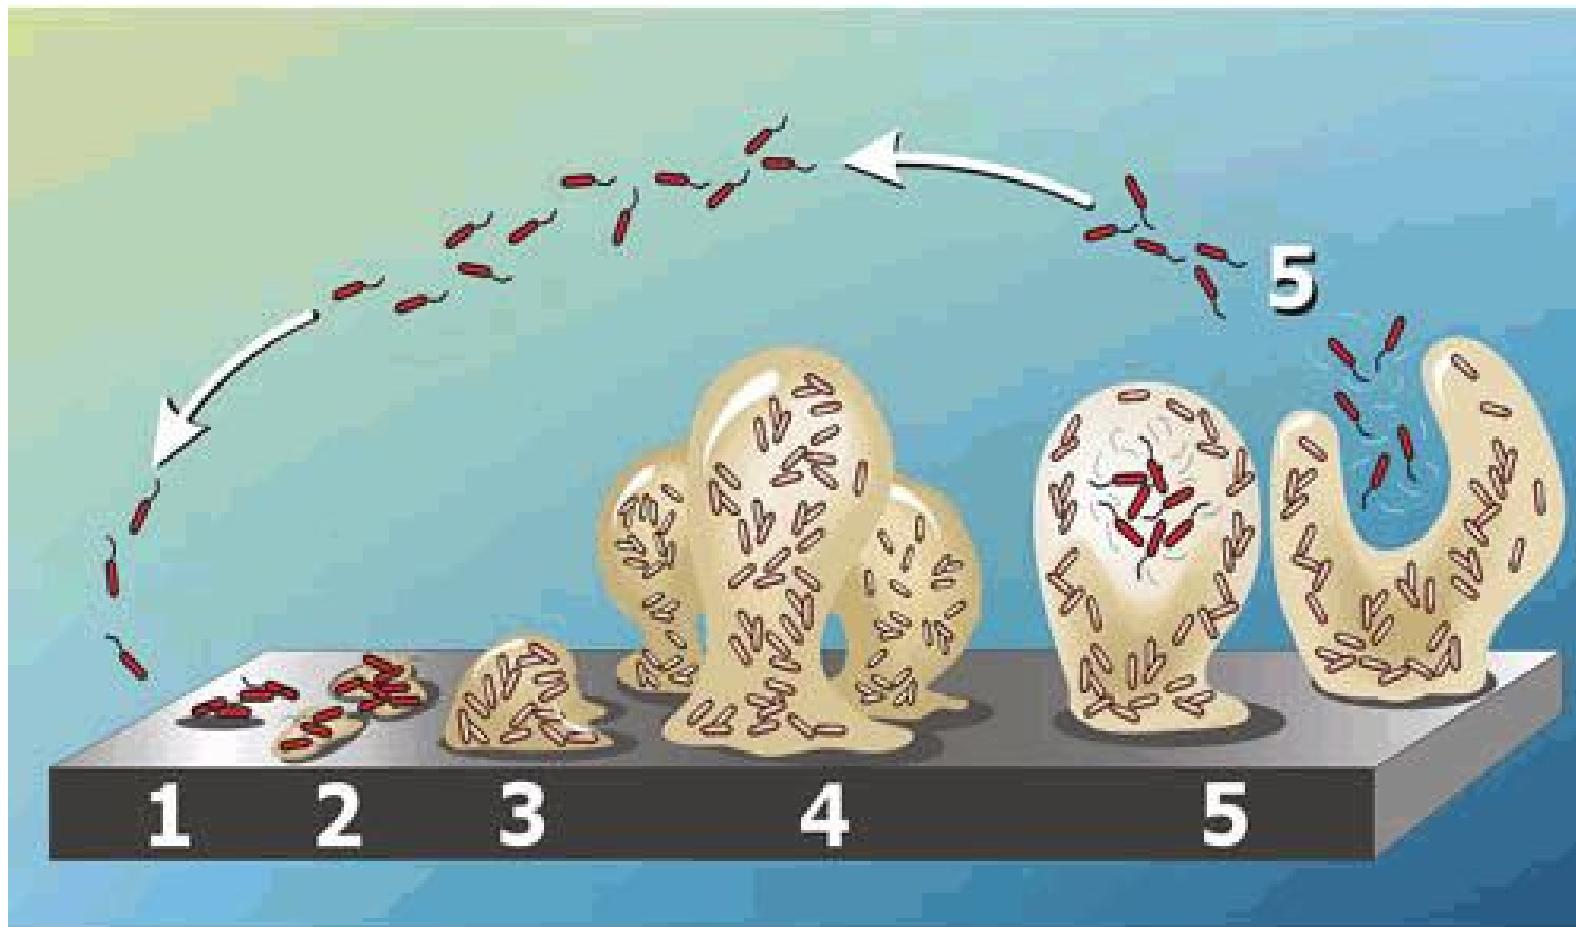

P. Dirckx

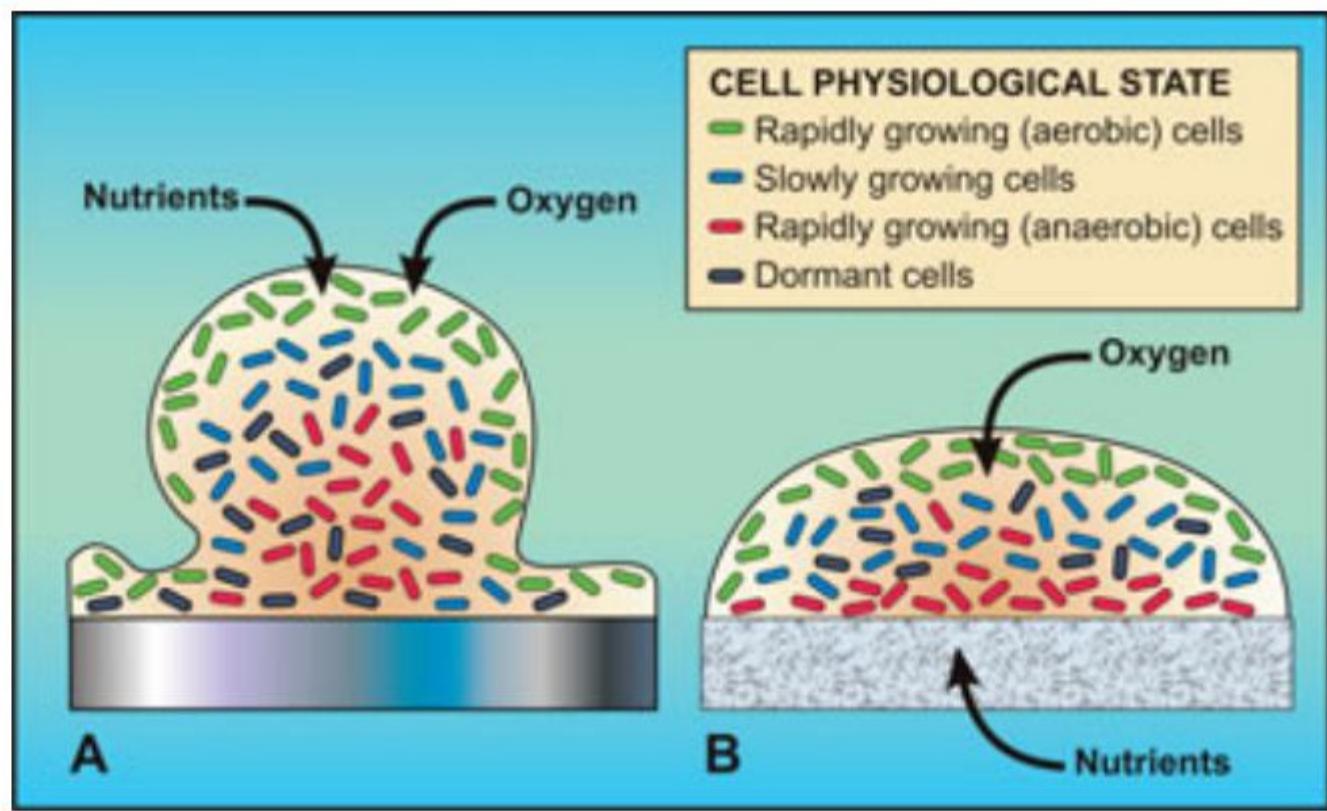

AN INTRODUCTION TO THE BIOFILM LIFE CYCLE: 1) Free-floating, or planktonic, bacteria encounter a submerged surface and within minutes can become attached. They begin to produce slimy extracellular polymeric substances (EPS) and to colonize the surface. 2) EPS production allows the emerging biofilm community to develop a complex, three-dimensional structure that is influenced by a variety of environmental factors. Biofilm communities can develop within hours. 3) Biofilms can propagate through detachment of small or large clumps of cells, or by a type of "seeding dispersal" that releases individual cells. Either type of detachment allows bacteria to attach to a surface or to a biofilm downstream of the original community.

Biofilm formation

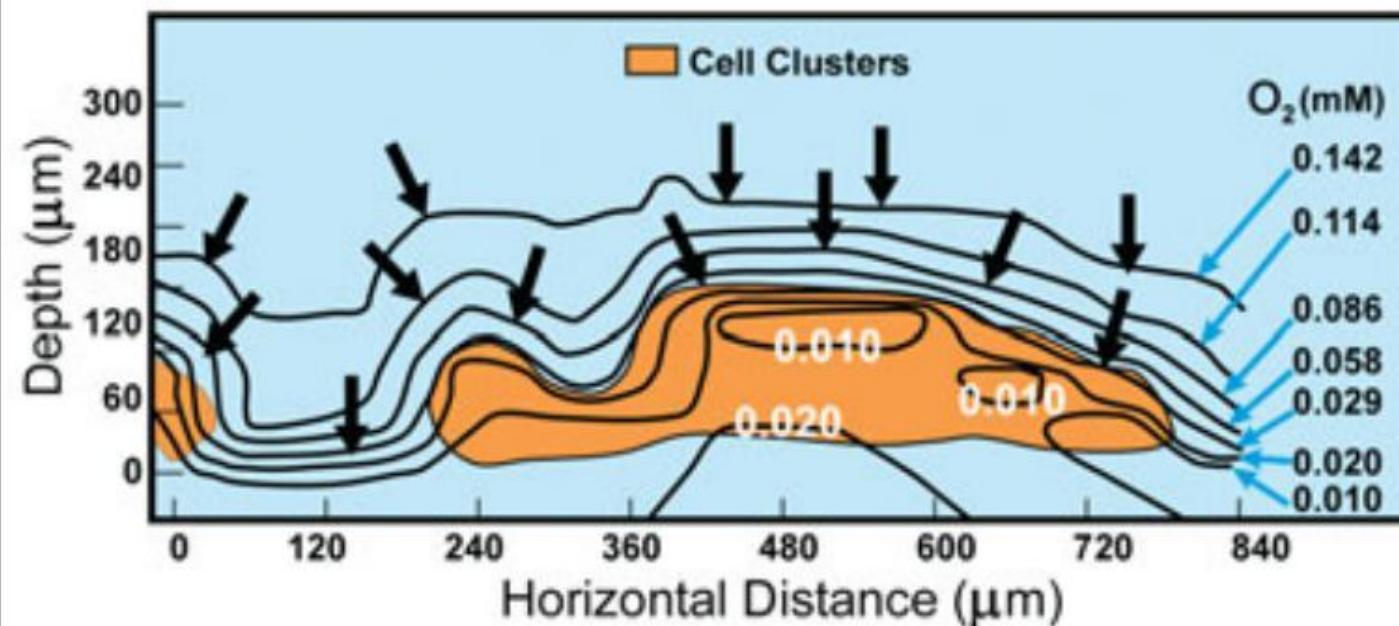

PHENOTYPIC HETEROGENEITY & DIFFERENTIATION

Cells of a given species can occupy a wide variety of phenotypic states in the same biofilm, from rapidly growing to dormant to expressing a unique activity. Mechanisms of diversification include nutrient gradients, mutation and natural selection, and genetic regulatory switches and signaling pathways.

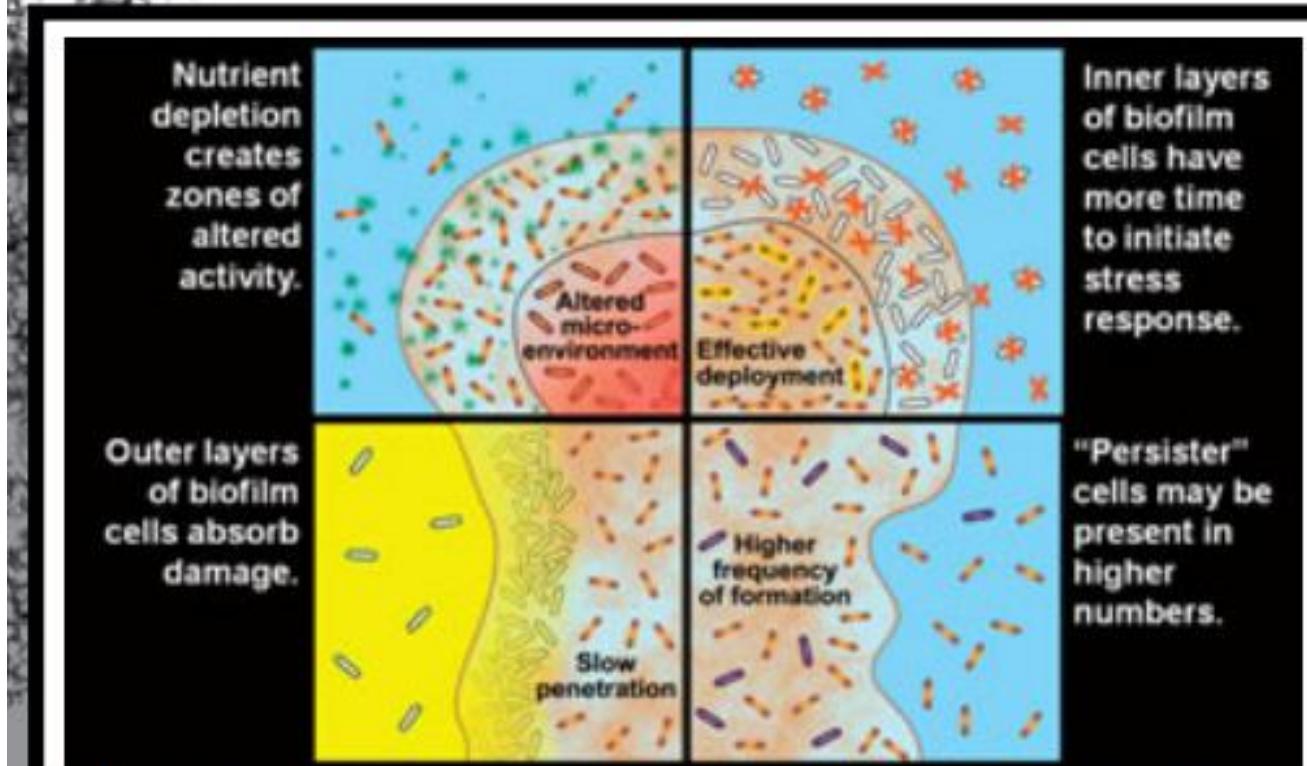

OXYGEN GRADIENTS

Mature biofilms are criss-crossed by gradients in the concentrations of metabolic substrates and products. Oxygen is the foremost example. Local depletion of oxygen allows anaerobic bacteria to thrive in the depths of a biofilm bathed in aerated water.

Plot of microsensor-detected gradients of dissolved oxygen in a biofilm: D de Beer, P Stoodley, Z Lewandowski, MSU-CBE

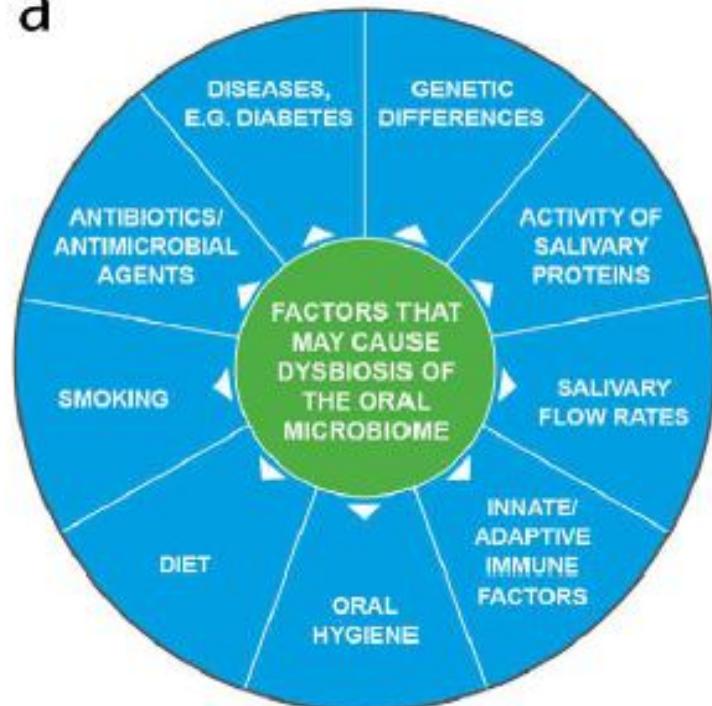

ANTIMICROBIAL TOLERANCE

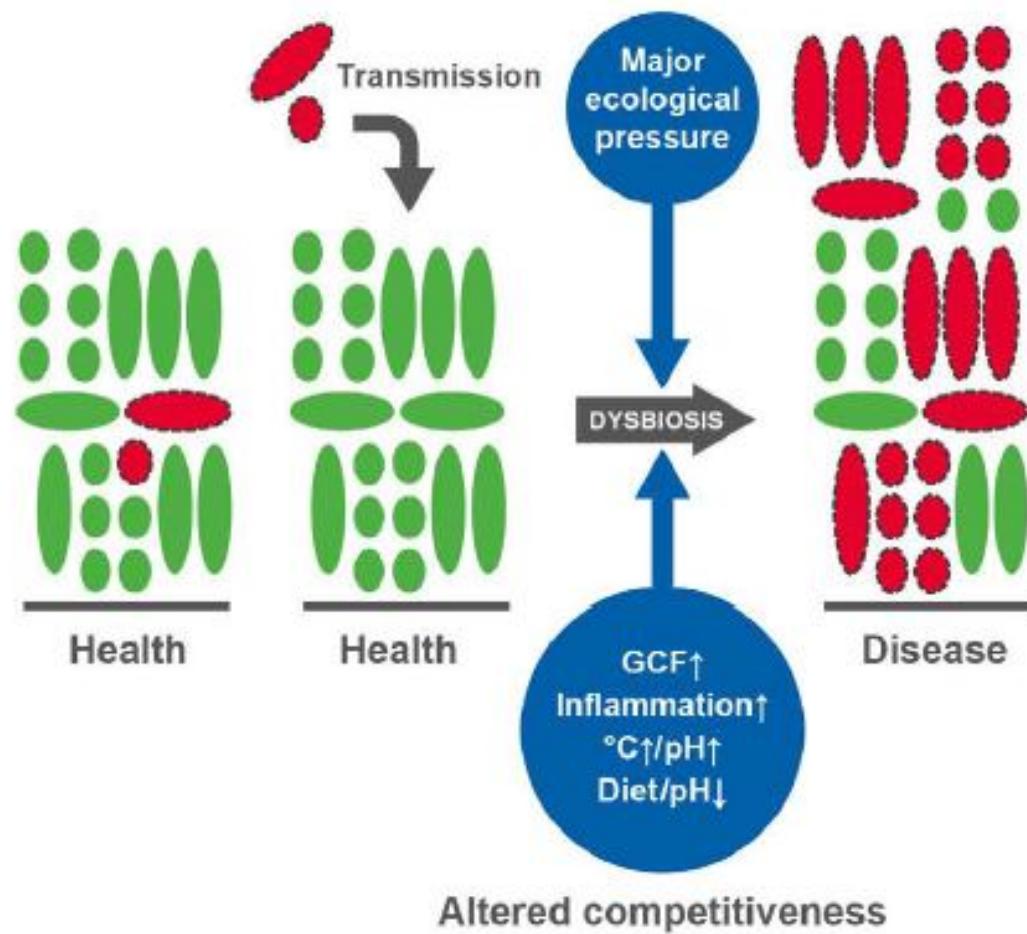

Microbes in biofilms are hard to kill with biocides or antibiotics. Protective mechanisms include poor penetration of reactive agents, non-growing cells whose inactivity makes them less vulnerable, and implementation of adaptive responses.
